

## **Burrowing Owl Behavior Survey Protocols – Night Observations**

When a burrowing owl (or potential predator) is detected, its location, flight characteristics, and other relevant behavioral information is recorded on a datasheet as well as a map (Table 1). For each detection during the behavior survey the following information is recorded: ID# for each individual, species identification (include adult or immature if possible), number of individuals, time, height above ground, closest distance to turbine row, if closest turbine is actively turning, and behavior (see Tables 2 and 3). If the bird being observed is perched, the type of perching structure and height (m) is also recorded (see Table 2 for list of perching structures and heights). After the initial observation, any major change in position or behavior during the observation period is also recorded as a detection (using the same individual number as the bird moves or changes behavior). To ensure that all perched birds within the observation area are identified, a scan of the entire plot is conducted with binoculars immediately before the survey period.

Observers also record the location of each sighting on a topographical map that includes the layout of the turbine row. Using the individual's ID#, the observer records the initial location of each bird and draws an arrow indicating initial and subsequent directions of movement. If a predation event (predators preying on or attempting to prey on burrowing owls) is observed, a detailed description should be written on the back of the data sheet, including predator/prey interactions and dispensation of prey (e.g., carried off whole, dismembered and eaten onsite, partially eaten onsite, etc.)

The observer using the thermal imaging scope should mainly focus on the turbine strings, while the observer using the night scope primarily focuses on the burrowing owl sightings/colonies and also records all the data. A small tripod should be used with the night scope and a blanket placed over the thermal imaging scope if necessary. Surveys should not be conducted when the average wind speed reaches more than 40 km/hr or if there is any rain or fog. Percent time the turbines are in operation during the survey period is recorded on the data sheet. Data recorded at control sites follow the same protocols, except instead of closest distance to turbine row they record the closest distance to the ridge line.

## Thermal Imaging Equipment

The thermal imaging scope tested previously was a FLIR model P640 High Definition Infrared Camera/Thermal Imager (<http://www.goinfrared.com/cameras/P-Series/thermacam-p640>) with a 12 degree (telephoto) lens on loan from FLIR Systems. A Sony Handycam DCR-HC32 Mini DV digital camcorder was attached to the P640 to record video of the thermal images using a standard A/V patch cable. The P640 was mounted on a Bogen tripod with a mini-fluid head suitable for spotting scopes and video. Although the P640 is no longer available, the P660 is available at the same cost. Cost of Thermal Camera rental is approximately \$5000 per month or \$1500 per week.

**Comment [S1]:** Doug – I used a two month rental in the cost estimates but I don't know if you will need all that time.

## Night Scope (TBA)

<b>Table 2. Behavior and feature codes used during burrowing owl observations.</b>

**Table 3. Burrowing Owl Behavior Code Definition**

<b>Code</b>	<b>Action</b>	<b>Definition</b>
<b>1</b>	<b>Flying upslope</b>	Directional flight powered by wing flaps
<b>2</b>	<b>Flying downslope</b>	Directional flight with no wing beats
<b>3</b>	<b>Flying parallel</b>	Few wing beats, and gradual turning, often powered by thermals
<b>4</b>	<b>Coursing Flight</b>	Low flying over burrowing owl colony
<b>5</b>	<b>Contouring</b>	Flights close to the terrain, and changing directions and height with the terrain
<b>6</b>	<b>Circling</b>	Tight circles with some wing beats
<b>7</b>	<b>Surfing</b>	Wind power flights usually perpendicular to wind direction
<b>8</b>	<b>Hovering</b>	Stationary position maintained using frequent wing beats.
<b>9</b>	<b>Soaring</b>	Few wing beats, and gradual turning, often powered by thermals
<b>10</b>	<b>Diving</b>	Wings recessed or folded for rapid downward flight, usually to attack prey or competitor
<b>11</b>	<b>Stooping from perch</b>	Diving after leaving perch
<b>12</b>	<b>Foraging</b>	
<b>13</b>	<b>Ground Hopping</b>	Hops along the ground while foraging
<b>14</b>	<b>Running</b>	Running on the ground
<b>15</b>	<b>Interacting</b>	Interactions with other species
<b>16</b>	<b>Fleeing</b>	Strong flight away from pursuer of similar or larger body size
<b>17</b>	<b>Flushing</b>	Chased off perch
<b>18</b>	<b>Landing</b>	
<b>19</b>	<b>Taking off</b>	Taking off without being flushed
<b>20</b>	<b>Perching</b>	
<b>21</b>	<b>Predation event or attempt</b>	Predator (avian or mammal) preys on BUOW
<b>22</b>	<b>Carrying Prey</b>	
<b>23</b>	<b>Copulating</b>	
<b>24</b>	<b>Other</b>
